Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kittrell et al in view of Wong et al ('039). Kittrell disclose a spectral diagnostic system and method which includes a percutaneous catheter that operates in the infrared range, a fiberoptic light guide, an IR detector and a spectrum analyzer for analyzing the detected spectrum. The peaks of the spectrum are analyzed to compare healthy tissue with diseased tissue. Wong et al disclose a device for detecting the presence of diseased tissue using ATR-FTIR. The device operates in the mid-infrared range as set forth in the claims. It would have been obvious to one skilled in the art to have modified Kittrell et al such that it uses ATR-FTIR for spectral analysis of the detected radiation. The modification would have merely involved the substitution of one well known type of spectral analysis of biological tissue for another.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Katzir discloses an apparatus for non-invasive in-vivo analysis of tissue using ATR-FTIR. The device can be used with an endoscope or catheter to compare healthy tissue with diseased tissue. The device works in the middle infrared range which includes the spectral range set forth in the claims.

Response to Arguments

Applicant's arguments with respect to claims 1-10 have been considered but are moot in view of the new ground(s) of rejection.
